# Time Series Database Interface: R SQLite (TSSQLite)

October 31, 2007

#### 1 Introduction

The code from the vignette that generates this guide can be loaded into an editor with edit(vignette("TSSQLite")). This uses the default editor, which can be changed using options(). It should be possible to view the pdf version of the guide for this package with print(vignette("TSSQLite")).

WARNING: running these example will overwrite tables in the SQLite "test" database on the server.

In SQLite there does not seem to be any need to set user or password information, and examples here all use the localhost.

Once R is started, the functions in this package are made available with

#### > library("TSSQLite")

This will also load required packages TSdbi, DBI, RSQLite, methods, and tframe. Some examples below also require zoo, and tseries.

The next small section of code is necessary to setup database tables. It needs to be done only once for a database and might typically be done by an administrator rather than an end user. A more detailed description of the instructions is given in the last section of this guide.

```
> m <- dbDriver("SQLite")
> con <- dbConnect(m, dbname = "test")
> source(system.file("TSsql/CreateTables.TSsql", package = "TSdbi"))
> dbDisconnect(con)
```

## 2 Using the Database - TSdbi Functions

This section gives several simple examples of putting series on and reading them from the database. (If a large number of series are to be loaded into a database, one would typically do this with a batch process using the database program's utilities for loading data.) The first thing to do is to establish a connection to the database:

```
> m <- dbDriver("SQLite")
> con <- TSconnect(m, dbname = "test")</pre>
```

TSconnect uses dbConnect from the DBI package, but checks that the database has expected tables, and checks for additional features. (It cannot be used before the tables are created, as done in the previous section.)

This puts a series called *vec* on the database and then reads is back

```
> z <- ts(rnorm(10), start = c(1990, 1), frequency = 1)
> seriesNames(z) <- "vec"
> if (TSexists("vec", con)) TSdelete("vec", con)
> TSput(z, con)
> z <- TSget("vec", con)</pre>
```

If the series is printed it is seen to be a "ts" time series with some extra attributes.

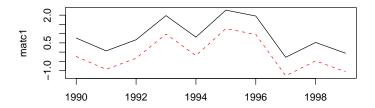

TSput fails if the series already exists on the con, so the above example checks and deletes the series if it already exists. TSreplace does not fail if the series does not yet exist, so examples below use it instead. Several plots below show original data and the data retrieved after it is written to the database. One is added to the original data so that both lines are visible.

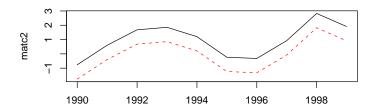

And now more examples:

```
> z < -ts(matrix(rnorm(20), 10, 2), start = c(1990, 1), frequency = 1)
> seriesNames(z) <- c("matc1", "matc2")</pre>
> TSreplace(z, con)
[1] TRUE
> TSget("matc1", con)
Time Series:
Start = 1990
End = 1999
Frequency = 1
                     2
                                3
                                                       5

> tfplot(z + 1, TSget(c("matc1", "matc2"), con), lty = c("solid", lty = lt
                                    "dashed"), col = c("black", "red"))
```

The following extract information about the series from the database, although not much information has been added for these examples.

```
> TSmeta("mat2c1", con)
```

- > TSmeta("vec", con)
- > TSdates("vec", con)
- > TSdescription("vec", con)
- > TSdoc("vec", con)

Below are exampoles that make more use of TSdescription and codeTSdoc. Often it is convenient to set the default connection:

> options(TSconnection = con)

and then the *con* specification can be omitted from the function calls unless another connection is needed. The *con* can still be specified, and some examples below do specify it, just to illustrate the alternative syntax.

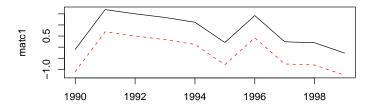

```
> z <- TSget("mat2c1")
> TSmeta("mat2c1")
serIDs: mat2c1 from dbname: test
description:
documentaion:
```

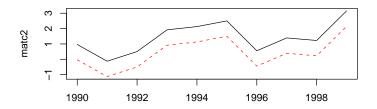

Data documentation can be in two forms, a description specified by TSde-scription or longer documentation specified by TSdoc. These can be added to
the time series object, in which case they will be written to the database when TSput or TSreplace is used to put the series on the database. Alternatively,
they can be specified as arguments to TSput or TSreplace. The description or
documentation will be retrieved as part of the series object with TSget only if
this is specified with the logical arguments TSdescription and TSdoc. They can
also be retrieved directly from the database with the functions TSdescriptionand TSdoc.

```
> z < -ts(matrix(rnorm(10), 10, 1), start = c(1990, 1), frequency = 1)
> TSreplace(z, serIDs = "Series1", con)
[1] TRUE
> zz <- TSget("Series1", con)
> TSreplace(z, serIDs = "Series1", con, TSdescription = "short rnorm series",
      TSdoc = "Series created as an example in the vignette.")
[1] TRUE
> zz <- TSget("Series1", con, TSdescription = TRUE, TSdoc = TRUE)
> start(zz)
[1] 1990
            1
> end(zz)
[1] 1999
            1
> TSdescription(zz)
[1] "short rnorm series"
> TSdoc(zz)
[1] "Series created as an example in the vignette."
> TSdescription("Series1", con)
[1] "short rnorm series"
> TSdoc("Series1", con)
```

```
[1] "Series created as an example in the vignette."
> z \leftarrow ts(rnorm(10), start = c(1990, 1), frequency = 1)
> seriesNames(z) <- "vec"
> TSreplace(z, con)
 [1] TRUE
> zz <- TSget("vec", con)
> z < -ts(matrix(rnorm(20), 10, 2), start = c(1990, 1), frequency = 1)
> seriesNames(z) <- c("matc1", "matc2")</pre>
> TSreplace(z, con)
 [1] TRUE
> tfplot(z + 1, TSget(c("matc1", "matc2"), con), lty = c("solid", lty = c("solid", lty = c("solid", lty = c("solid", lty = l
```

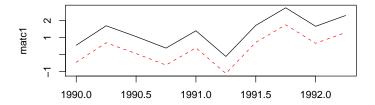

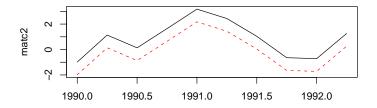

```
> z < -ts(matrix(rnorm(20), 10, 2), start = c(1990, 1), frequency = 4)
> seriesNames(z) <- c("matc1", "matc2")</pre>
> TSreplace(z, con)
```

#### [1] TRUE

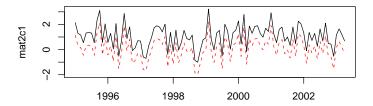

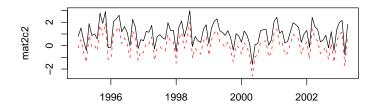

```
> z <- ts(matrix(rnorm(200), 100, 2), start = c(1995, 1), frequency = 12) > seriesNames(z) <- c("mat2c1", "mat2c2") > TSreplace(z, con)
```

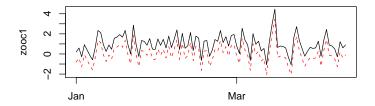

#### [1] TRUE

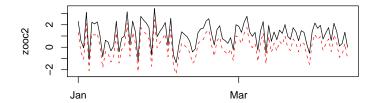

> tfplot(z + 1, TSget(c("mat2c1", "mat2c2"), con), lty = c("solid", "dashed"), col = c("black", "red"))

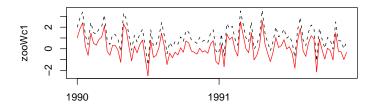

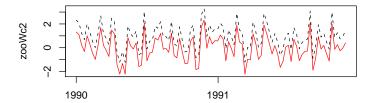

The following examples use dates and times which are not handled by ts, so the zoo time representation is used.

> dbDisconnect(con)

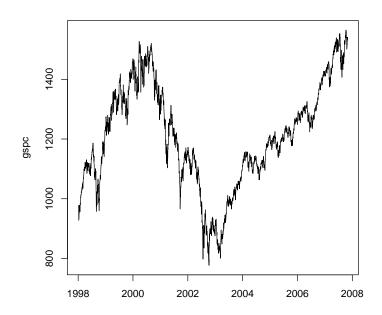

#### 2.1 Examples Using TSdbi with ets

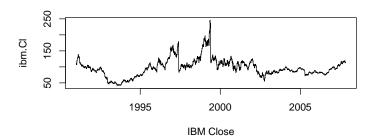

The database called "ets" is available at the Bank of Canada. These examples are illustrated in the TSMySQL and TSpadi packages, but ets is not yet implemented under TSSQLite.

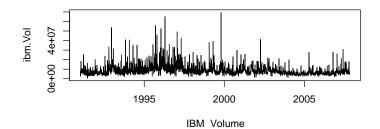

## 3 Examples Using get.hist.quote

This section illustrates fetching data from elsewhere and loading it into the database. This would be a very slow way to load a database, but provides examples of different kinds of time series data.

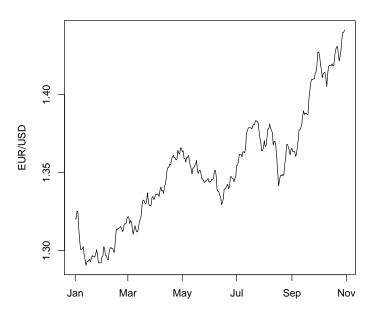

The fetches are wrapped in try() and a flag quote.ok set because the fetch attempt may fail due to lack of an Interenet connection or delays.

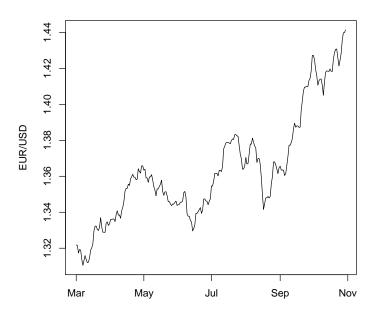

```
> if (quote.ok) {
     tfplot(z, Title = "EUR/USD", start = "2007-01-01")
}
```

## EUR/USD

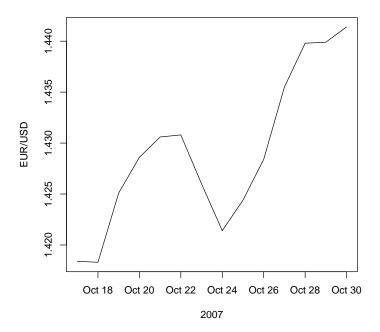

```
> if (quote.ok) {
     tfplot(z, Title = "EUR/USD", start = "2007-03-01")
}
```

### EUR/USD

#### **EUR/USD**

- > dbDisconnect(options()\$TSconnection)
- > options(TSconnection = NULL)

## 4 Examples Using DBI and direct SQL Queries

The following examples are queries using the underlying "DBI" functions. They should not often be needed to access time series, but may be useful to get at more detailed information, or formulate special queries.

```
> m <- dbDriver("SQLite")
> con <- TSconnect(m, dbname = "test")
> options(TSconnection = con)

> dbListTables(con)

[1] "A" "B" "D" "I" "M" "Meta" "Q" "S" "T" "U"
[11] "W"
```

If schema queries are supported then table information can be obtained in a (almost) generic SQL way. On some systems this will fail because users do not have read priveleges on the INFORMATION\_SCHEMA table. This does not seem to be an issue in SQLite, but I have not figured out the SQLite implementation so the following are wrapped in try().

Table 1: Data Tables

Table	Contents
Meta	meta data and index to series data tables
A	annual data
Q	quarterly data
M	monthly data
$\mathbf{S}$	semiannual data
W	weekly data
D	daily data
В	business data
U	minutely data
I	irregular data with a date
${ m T}$	irregular data with a date and time

- > try(dbGetQuery(con, paste("SELECT COLUMN\_NAME FROM INFORMATION\_SCHEMA.Columns ", "WHERE TABLE\_SCHEMA='test' AND table\_name='A';")))
- > try(dbGetQuery(con, paste("SELECT COLUMN\_NAME, COLUMN\_DEFAULT, COLLATION\_NAME, DATA\_TYPE, "CHARACTER\_SET\_NAME, CHARACTER\_MAXIMUM\_LENGTH, NUMERIC\_PRECISION",
  - "FROM INFORMATION\_SCHEMA.Columns WHERE TABLE\_SCHEMA='test' AND table\_name='A' ;")))
- > try(dbGetQuery(con, paste("SELECT COLUMN\_NAME, DATA\_TYPE, CHARACTER\_MAXIMUM\_LENGTH, NUMER: "FROM INFORMATION\_SCHEMA.Columns WHERE TABLE\_SCHEMA='test' AND table\_name='M';")))

Finally, to disconnect gracefully, one should

- > dbDisconnect(options()\$TSconnection)
- > options(TSconnection = NULL)

## 5 Administration: Database Table Setup

The instructions in this section can be done in R using instructions in the file CreateTables.TSsql in the TSdbi package (distributed in TSdbi/inst/TSsql/). A simple way to do this was illustrated in the Introduction. Below the plain SQL instruction are shown. These could be executed in the mysql standalone client. This might be convenient when bulk loading data. (Example makefiles might sometime be available from the author.)

The database tables are shown in the Data Tables table. The *Meta* table is used for storing meta data about series, such as a description and longer documentation, and also includes an indication of what table the series data is stored in. To retrieve series it is not necessary to know which table the series is on, since this can be found on the *Meta* table. Putting data on the database may require specifying the table, if it cannot be determined from the R representation of the series.

The tables can be set up with the following commands. (Please note that this documentation is not automatically maintained, and could become out-of-date. The instructions in the file TSsql/CreateTables.TSsql are tested automatically, and thus guaranteed to be current.)

```
DROP TABLE IF EXISTS Meta;
create table Meta (
   id
               VARCHAR(40) NOT NULL,
   tbl
               CHAR(1),
               VARCHAR(10) default NULL,
   refPeriod
   description
                 TEXT,
   documentation
                     TEXT,
   PRIMARY KEY (id)
   );
DROP TABLE IF EXISTS A;
create table A (
   id
            VARCHAR(40),
   year
              INT,
        double DEFAULT NULL
   v
   );
DROP TABLE IF EXISTS B;
create table B (
   id
            VARCHAR(40),
   date
              DATE,
   period
              INT,
        double DEFAULT NULL
   );
DROP TABLE IF EXISTS D;
create table D (
   id
            VARCHAR(40),
   date
              DATE,
   period
              INT,
        double DEFAULT NULL
   );
DROP TABLE IF EXISTS M;
create table M (
            VARCHAR(40),
   id
```

```
year INT, period INT,
  v double DEFAULT NULL
  );
DROP TABLE IF EXISTS U;
create table U (
  id VARCHAR(40),
         DATETIME,
  date
          VARCHAR(4), #not tested
  period
           INT,
  v double DEFAULT NULL
  );
DROP TABLE IF EXISTS Q;
create table Q (
  id VARCHAR(40),
           INT,
  year
  period INT,
  v double DEFAULT NULL
  );
DROP TABLE IF EXISTS S;
create table S (
  id VARCHAR(40),
  year
           INT,
  period
           INT,
  v double DEFAULT NULL
  );
DROP TABLE IF EXISTS W;
create table W (
  id VARCHAR(40),
  date
           DATE,
  period
           INT,
  v double DEFAULT NULL
  );
DROP TABLE IF EXISTS I;
create table I (
  id
     VARCHAR(40),
```

```
double DEFAULT NULL
   );
DROP TABLE IF EXISTS T;
create table T (
   id
         VARCHAR (40),
   date DATETIME,
         double DEFAULT NULL
   );
  Indexes can be generated as follows. (It may be quicker to load data before
generating indices.)
 CREATE INDEX Metaindex_tbl ON Meta (tbl);
 CREATE INDEX Aindex_id
                            ON A (id);
 CREATE INDEX Aindex_year
                            ON A (year);
 CREATE INDEX Bindex_id
                            ON B (id);
 CREATE INDEX Bindex_date
                            ON B (date);
 CREATE INDEX Bindex_period ON B (period);
 CREATE INDEX Dindex_id
                            ON D (id);
 CREATE INDEX Dindex_date ON D (date);
 CREATE INDEX Dindex_period ON D (period);
 CREATE INDEX Mindex_id
                            ON M (id);
 CREATE INDEX Mindex_year
                            ON M (year);
 CREATE INDEX Mindex_period ON M (period);
                            ON U (id);
 CREATE INDEX Uindex_id
 CREATE INDEX Uindex_date
                            ON U (date);
 CREATE INDEX Uindex_period ON U (period);
 CREATE INDEX Qindex_id
                            ON Q (id);
 CREATE INDEX Qindex_year
                            ON Q (year);
 CREATE INDEX Qindex_period ON Q (period);
 CREATE INDEX Sindex_id
                            ON S (id);
 CREATE INDEX Sindex_year
                            ON S (year);
 CREATE INDEX Sindex_period ON S (period);
 CREATE INDEX Windex_id
                            ON W (id);
 CREATE INDEX Windex_date ON W (date);
 CREATE INDEX Windex_period ON W (period);
 CREATE INDEX Iindex_id
                            ON I (id);
 CREATE INDEX Iindex_date
                            ON I (date);
 CREATE INDEX Tindex_id
                          ON T (id);
```

date

DATE,

CREATE INDEX Tindex\_date ON T (date);

In SQLite you can check table information (eg. table  $\boldsymbol{A}$  ) with describe  $\boldsymbol{A}$ ;

In sqlite3 data might typically be loaded into a table with command like LOAD DATA LOCAL INFILE 'A.csv' INTO TABLE A FIELDS TERMINATED BY ','; .import 'A.csv' A

Of course, the corresponding Meta table entries also need to be made.
